

# The COUGAR

Shown at right is our Cougar model, which is a fully hydraulic mill. The TH-head style that is shown in the middle 2 pictures is a more balanced design, more open space in the throat to allow crooked logs to pass easily. This is a state of the art bandsaw with 3x6 main frame and 2x2 head frame.

We recommend clean face sawing by reversing the post and clamp positions and sawing against the clamps. We can build either way.

The above views show our PUMA head. It is the same as the COUGAR head, except for hydraulic controls. Easier engine replacement & repair. Dial indicator disk will be twice as large to allow reading numbers when head is at the far end of mill.

Log turner slides sideways 12 inches to allow better control of log.

Note the drag backs that return lumber to the operator's end.

Wobblestick controls on a frame that hinges against the frame for transport.
